

Asepect Oriented Programming

Filters --> Wrap a Raw incoming Request

Interceptors --> Wrap a controller

Business Logic --> DOmains

Infra Logic / Supporting Logic

-> Scattering

-> Tangling

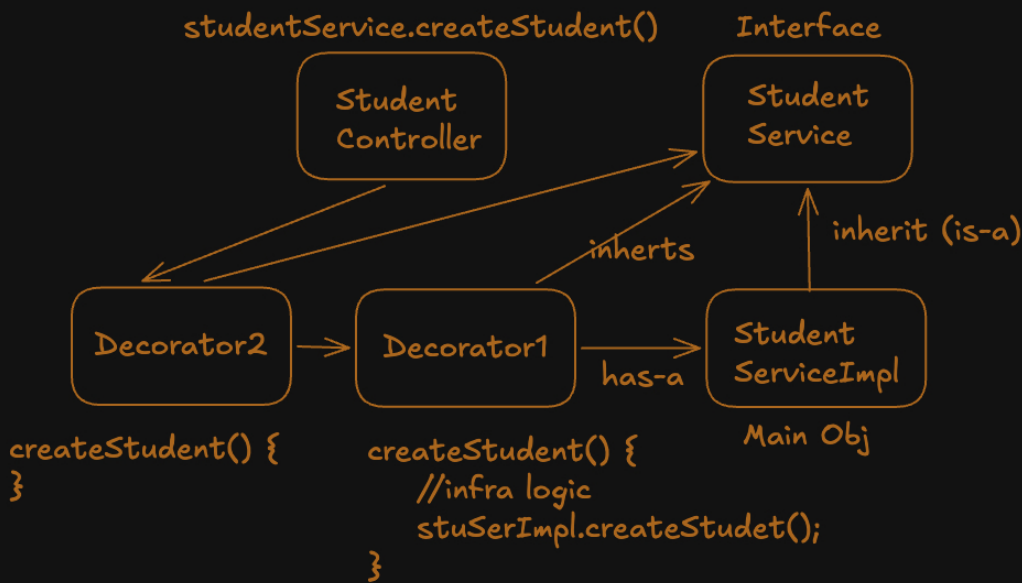

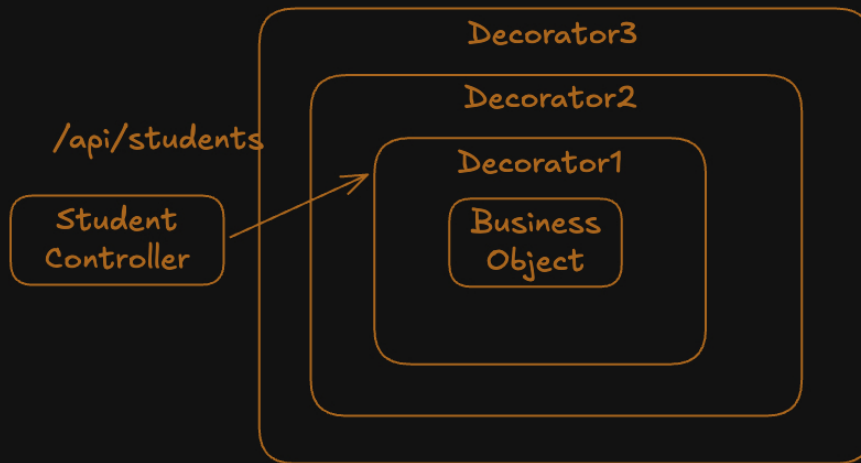

```
public Student createStudent(Student student) {  
  
    log.info("Method started");  
    securityService.checkPermission("CREATE_STUDENT");  
  
    long start = System.currentTimeMillis();  
  
    try {  
        Student result = studentRepository.save(student);  
  
        auditService.record("STUDENT_CREATED");  
  
        return result;  
    } catch (Exception exception) {  
        log.error("Method failed", exception);  
        throw exception;  
    } finally {  
        metrics.record(  
            System.currentTimeMillis() - start  
        );  
    }  
}
```

```
public Student createStudent(Student student) {  
    return studentRepository.save(student);  
}
```

1. Making Helper Function

2. Inheritance

3. Wrapper classes --> Decorator Design Pattern

1. Service --> Wrapper

WHAT --> Logging
 WHERE --> All service class --> all methods
 WHEN --> method start and method end
